

Portfolio User Guide

Navigation, Project Review and Use of Public Resources

Author	Mersie Ademova
System	Personal Engineering, Software Development and Research Portfolio
Website	https://mersiademova.github.io/mersiademova.github.io/index.html
Version	1.0
Date	August 2026

This document describes the public portfolio as published in August 2026.

Document Control

Version	Date	Author	Status
1.0	August 2026	Mersie Ademova	Initial public documentation

Purpose: to help visitors navigate the portfolio, inspect projects and case studies, open live applications and source code, view documents, and contact the author.

15. Quick Reference

1. Introduction

This guide explains how to use the public portfolio of Mersie Ademova. The website presents software systems, embedded and engineering projects, computational research, academic papers, technical studies, source-code repositories, live application demonstrations, and detailed case studies.

The portfolio is intended for professors, reviewers, employers, collaborators, students, and other visitors who want to understand the author's work, methods, and technical development.

2. System Requirements

- a current web browser such as Chrome, Edge, Firefox or Safari;
- an internet connection for the website and external resources;
- PDF viewing support for academic papers and documentation;
- JavaScript enabled for mobile navigation, animations, sliders and project filtering;
- GitHub access for source-code repositories;
- Streamlit access for selected live applications.

No installation required

The portfolio itself is a public website and does not require registration, account creation or software installation.

3. Opening the Portfolio

Open the following address in a web browser:

<https://mersiademova.github.io/mersieademova.github.io/index.html>

The Home page displays the author's name, professional roles, central portfolio statement, and a direct link to the About page.

4. Main Navigation

The navigation menu appears at the top of the website. On smaller screens, it is opened through the menu icon.

Menu item	Purpose
Home	Return to the introduction and professional statement.
About	Read the author profile, interdisciplinary approach and collaborator section.
Resume	Review education and professional or independent development experience.
What I Do	Review capability areas such as engineering, development, systems analysis, computation, research and technical writing.
Portfolio	Browse the main software, embedded and computational projects.

Menu item	Purpose
Additional Writings	Open academic papers, technical studies, specifications and code-supported writing.
Documentation	Open the Technical Documentation or this User Guide.
Contact	Use email, LinkedIn or GitHub to contact or review the author.

5. Using the Portfolio Page

Select Portfolio from the main navigation to open the project gallery. Projects are organized into the following categories:

- **Software Systems** – complete software applications, decision-support systems and analytical tools.
- **Embedded & Engineering Systems** – RFID and hardware-integrated access-control prototypes.
- **Computational Research & Experiments** – data, numerical and algorithmic projects focused on experimentation and evaluation.

5.1 Filtering projects

Use the category controls near the top of the Portfolio page to display all projects or only the projects from a selected category. Selecting All restores the complete gallery.

5.2 Opening a project

Select a project card or image to open its project overview page. The overview usually contains screenshots, category information, project status, role information, a short explanation and one or more action buttons.

6. Reviewing a Project

6.1 Project information

- Category identifies the general project area.
- Project type describes whether the work is a software system, prototype, academic application, experiment or research project.
- Project date indicates the principal development period.
- Status describes whether the project is complete, functional, prototype-based or under further development.
- Role lists the author's responsibilities in analysis, development, architecture, research, database design, testing or documentation.

6.2 Project images

Use the arrows or pagination indicators in the image slider to inspect application screens, graphs, reports, hardware prototypes or other visual evidence.

6.3 View Case Study

Select View Case Study to open the detailed project analysis. Case studies typically explain the problem, objectives, functionality, methods, architecture, workflow, testing, outcome, strengths, limitations and available materials.

Recommended review path

For a fast review, read the project overview. For academic or technical evaluation, continue to the case study and then open the source code, live application or supporting document.

7. Using Live Web Applications

Some projects include a Live Web Application button. Selecting it opens an interactive Streamlit application in a new browser tab.

- wait a few seconds if the application is waking from an inactive state;
- use the controls, tables and graphs provided inside the application;
- return to the portfolio tab after completing the demonstration;
- use Reboot only from the application owner's Streamlit workspace, not as a normal public visitor.

A Streamlit error or temporary loading delay may be caused by the external hosting service. It does not automatically indicate that the portfolio page or project source code is defective.

8. Opening Source Code and README Files

Select Source Code or GitHub Repository to open the project repository. A typical repository contains:

- source-code files;
- README.md with project purpose, features, setup and usage;
- requirements or dependency information;
- screenshots or supporting project materials;
- version history through Git commits.

8.1 Reading the README

The README is the recommended starting point. It explains what the project does, how it is structured, which technologies it uses, how to run it locally, and which limitations apply.

8.2 Downloading or cloning code

Visitors familiar with GitHub may use Code → Download ZIP or clone the repository with Git. The portfolio does not require local installation unless the visitor chooses to run the source code independently.

9. Viewing Academic and Technical Documents

Select View Document, Academic Paper, Technical Documentation or another document link to open the related file. Most public documents use PDF format so they can be viewed consistently in the browser.

- use the browser's built-in PDF controls to zoom, search, print or download;
- return to the portfolio using the previous browser tab or the Back command;
- open Additional Writings to browse research and academic documents that are not presented as main portfolio projects.

10. Using the Documentation Menu

The Documentation item contains two resources:

- **Technical Documentation** – describes the website architecture, technologies, page structure, deployment, maintenance, security and limitations.
- **User Guide** – explains how visitors navigate the site and use its public project resources.

Both documents describe the portfolio version published in August 2026 and should be updated when the website structure or navigation changes significantly.

11. Contacting the Author

Open Contact from the navigation menu. The page provides:

- email for detailed professional or academic inquiries;
- LinkedIn for professional profile and networking;
- GitHub for repositories and public development work.

Email is the preferred method for detailed questions about projects, systems analysis, software development, computational research or technical writing.

12. Mobile and Tablet Use

- tap the menu icon to open or close the navigation;
- use the dropdown arrow to open nested menu items;
- scroll horizontally only when a wide technical table requires it;
- project cards and case-study sections automatically stack into a single-column layout on narrow screens;
- external links may open in a separate browser tab or application.

13. Troubleshooting

Problem	Recommended action
A page does not reflect a recent update	Refresh the page with Ctrl + Shift + R or clear the browser cache.
A Streamlit app shows an error	Wait briefly and retry. The application may require a reboot by the owner or the external service may be temporarily unavailable.
A GitHub link does not open	Check the internet connection and try opening the repository in a new tab.
A document does not open	Allow PDF viewing or downloading in the browser, then retry the link.
The mobile menu is not visible	Reload the page and confirm that JavaScript is enabled.
Images load slowly	Wait for the page to complete loading or use a more stable connection.
A social link opens the wrong account	Report the problem by email so the public link can be corrected.

14. Accessibility and External-Service Notes

- the site uses responsive layouts and visible text labels for primary actions;

- keyboard behavior may vary between the portfolio and third-party services;
- screen-reader interpretation depends on page headings, alternative text and the external platform being opened;
- GitHub, Streamlit, LinkedIn and social-media pages have their own accessibility, privacy and account policies;
- the portfolio does not control temporary service interruptions or changes made by external platforms.

15. Quick Reference

Goal	Navigation path
Understand the author	Home → About → Resume
Review capabilities	What I Do
Browse main projects	Portfolio
Read complete project reasoning	Project → View Case Study
Try an interactive project	Project → Live Web Application
Inspect implementation	Project → Source Code
Read academic work	Additional Writings or View Document
Understand the website technically	Documentation → Technical Documentation
Contact the author	Contact → Email

Final note

The portfolio is designed to support both a quick professional overview and a detailed technical review. Visitors may stop at the overview level or continue through case studies, source code, live applications and supporting documents.
